Step 1 Moment of inertia Acceleration/deceleration

- Calculating the moment of inertia.
- Checking the moment of inertia vs. acceleration/deceleration. Select an appropriate model from the moment of inertia vs. acceleration/deceleration while referring to the moment of inertia vs. acceleration/deceleration graph.

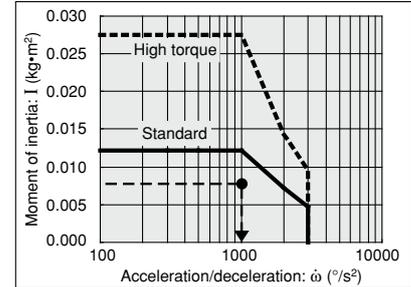

Calculation formula

$$I = m \times (a^2 + b^2) / 12 + m \times H^2$$

Selection example

$$I = 2.0 \times (0.15^2 + 0.08^2) / 12 + 2.0 \times 0.04^2 = 0.00802 \text{ kg} \cdot \text{m}^2$$

RF03

Step 2 Selecting a torque

- Kinds of loads
 - Static load: T_s
 - Resistance load: T_f
 - Inertial load: T_a
- Checking the effective torque
 Check that the speed can be controlled by the effective torque by the speed while referring to the effective torque vs. speed graph.

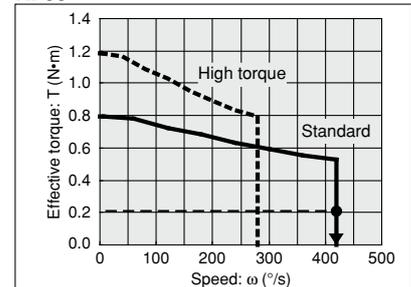

Calculation formula

$$\begin{aligned} \text{Effective torque} &\geq T_s \\ \text{Effective torque} &\geq T_f \times 1.5 \\ \text{Effective torque} &\geq T_a \times 1.5 \end{aligned}$$

Selection example

$$\begin{aligned} \text{Inertial load: } T_a \\ T_a \times 1.5 &= I \times \dot{\omega} \times 2\pi / 360 \times 1.5 \\ &= 0.00802 \times 1,000 \times 0.0175 \times 1.5 \\ &= 0.21 \text{ N} \cdot \text{m} \end{aligned}$$

RF03

Step 3 Allowable load

- Checking the allowable load
 - Radial load
 - Thrust load
 - Moment

Calculation formula

$$\begin{aligned} \text{Allowable thrust load} &\geq m \times 9.8 \\ \text{Allowable moment} &\geq m \times 9.8 \times H \end{aligned}$$

Selection example

$$\begin{aligned} \text{Thrust load} \\ 2.0 \times 9.8 &= 19.6 \text{ N} < \text{Allowable load OK} \\ \text{Allowable moment} \\ 2.0 \times 9.8 \times 0.04 \\ &= 0.784 \text{ N} \cdot \text{m} < \text{Allowable moment OK} \end{aligned}$$

How to find the inertia moment

The tool and work are not usually a simple shape so calculating the inertia moment is not easy.

As a method, the load is replaced with several factors that resemble a simple form for which the moment of inertia can be calculated. The total of the moment of inertia for these factors is then obtained. The objects and equations often used for the calculation of the moment of inertia are shown below. Incidentally, there is the following relation: $J \text{ (kgfcmsec}^2\text{)} = I \text{ (kgm}^2\text{)} \times 10.2$

Example of moment of inertia calculation

Let's discuss an example in which the chuck and workpiece are at a position offset by 10cm from the R-axis by a stay, as shown in Fig. ⑧. The moment of inertia is calculated with the following three factors, assuming that the load material is steel and its density ρ is 0.0078kg/cm^3 .

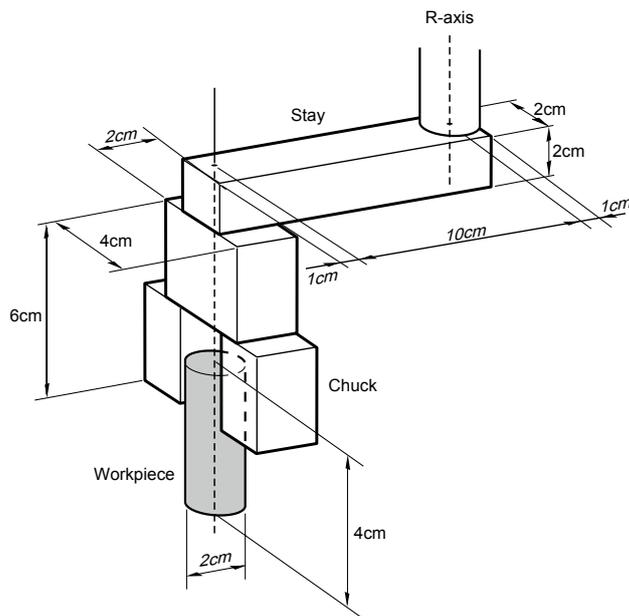

Fig. ⑧

[1] Moment of inertia of the stay

From Fig. ⑨, the weight of the stay (W_s) is given as follows :

$$W_s = \rho abc = 0.0078 \times 12 \times 2 \times 2 = 0.37 \text{ (kgf)}$$

The moment of inertia of the stay (J_s) is then calculated from Eq. 3-7.

$$J_s = \frac{0.37 \times (12^2 + 2^2)}{12 \times 980} + \frac{0.37 \times 5^2}{980} = 0.014 \text{ (kgfcmsec}^2\text{)}$$

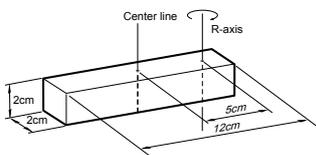

Fig. ⑨

[4] Total weight

$$W = W_s + W_c + W_w = 0.84 \text{ (kgf)}$$

[5] Total moment of inertia

$$J = J_s + J_c + J_w = 0.062 \text{ (kgfcmsec}^2\text{)}$$

[2] Moment of inertia of the chuck

When the chuck form resembles that shown in Fig. ⑩, the weight of the chuck (W_c) is

$$W_c = 0.0078 \times 2 \times 4 \times 6 = 0.37 \text{ (kgf)}$$

The moment of inertia of the chuck (J_c) is then calculated from Eq. 3-7.

$$J_c = \frac{0.37 \times (2^2 + 4^2)}{12 \times 980} + \frac{0.37 \times 10^2}{980} = 0.038 \text{ (kgfcmsec}^2\text{)}$$

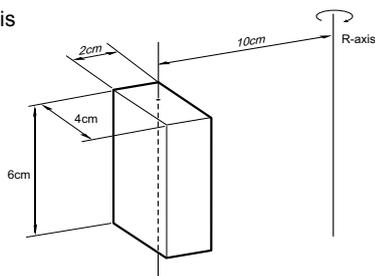

Fig. ⑩

[3] Moment of inertia of workpiece

When the workpiece form resembles that shown in Fig. ⑪, the weight of the workpiece (W_w) is

$$W_w = \frac{\rho \pi D^2 h}{4} = \frac{0.0078 \pi \times 2^2 \times 4}{4} = 0.098 \text{ (kgf)}$$

The moment of inertia of the workpiece (J_w) is then calculated from Eq. 3-5.

$$J_w = \frac{0.097 \times 2^2}{8 \times 980} + \frac{0.097 \times 10^2}{980} = 0.010 \text{ (kgfcmsec}^2\text{)}$$

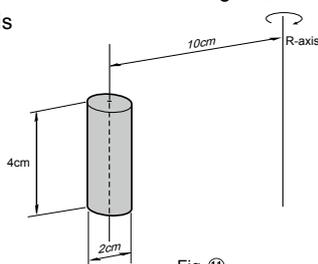

Fig. ⑪

External safety circuit examples

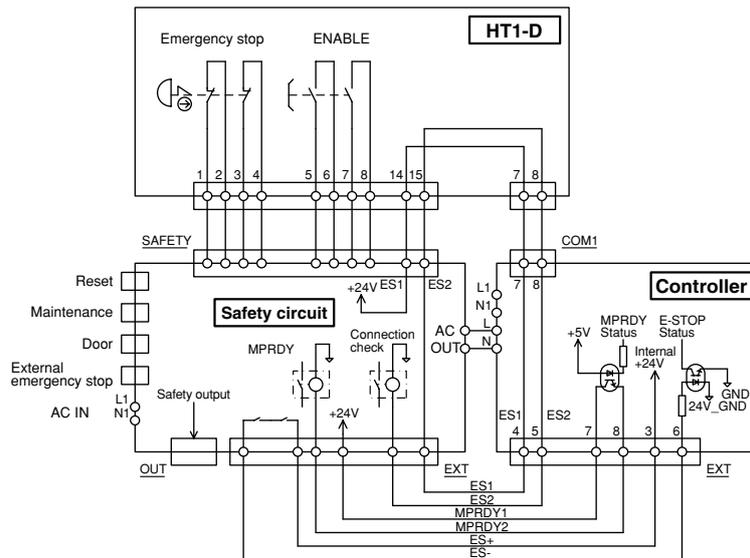

To ensure safe use of the robot, we request the customers make a risk assessment of their end equipment to decide what performance level is needed from safety circuits at the point. Customer should then install a safety circuit at the required performance level.

Here we show examples of category 4 circuits for the TS-X/TS-P, SR1 and RCX240 controllers using a programming box with an enable switch.

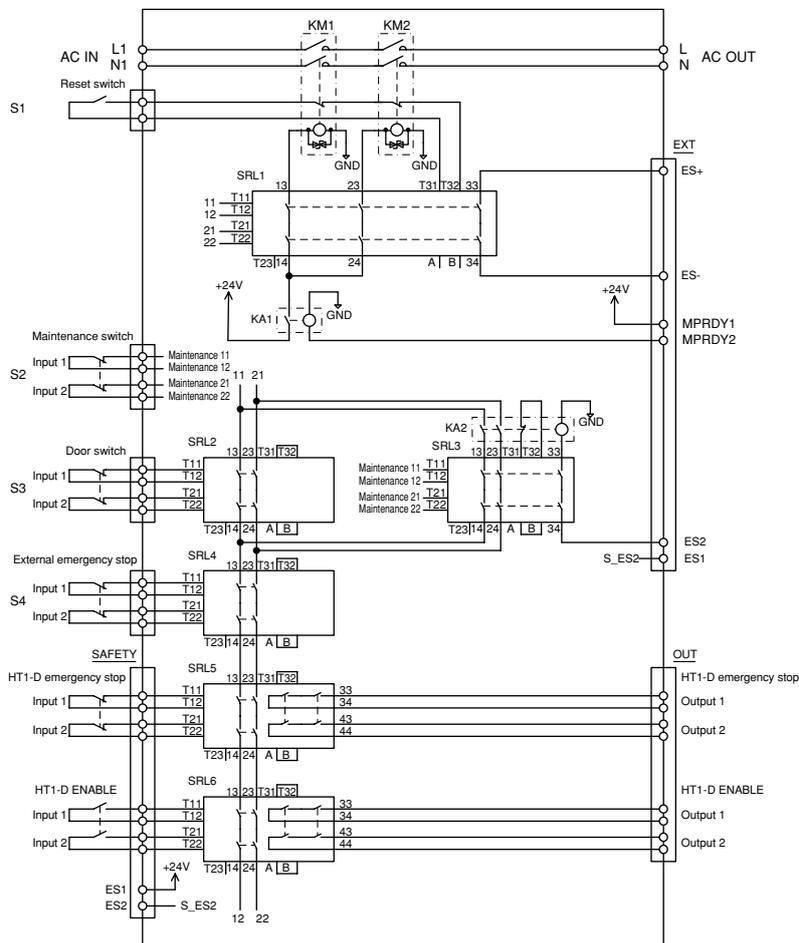

Safety circuits for other categories are described in the user's manuals, so download them from our website if needed.

Cautions regarding CE specifications

■ CE marking

The YAMAHA robot (robot and controller) is one component that is incorporated into the customer's system (built-in equipment), and we declare that the YAMAHA robots conform to the EC Directives only within the scope of built-in equipment (semi-finished product). So, no CE marks are affixed to the YAMAHA robot products.

■ Cautions regarding compliance with EC Directives

The YAMAHA robot (robot and controller) is not, in itself, a robot system. The YAMAHA robot-series product is one component that is incorporated into the customer's system (built-in equipment), and we declare that the YAMAHA robots conform to the EC Directives only within the scope of built-in equipment. Just incorporating the YAMAHA robot does not guarantee that the customer's system conforms to the EC Directives. However, combining the YAMAHA robot that is a semi-finished product with other device or circuit that is designed and manufactured appropriately makes it possible to conform the finished system to the EC Directives. The customer who incorporates YAMAHA robot products into the customer's final system, which will be shipped to or used in European region, should verify that the overall system conforms to the EC Directives.

■ Installation of external safety circuits

To comply with EC directives, customers using YAMAHA robots must always build and install their own external safety circuits after selecting product components (safety relays, etc.) according to performance levels and safety categories required by the customer equipment.

For details about examples of external safety circuits, the user's manual should be referred to.

■ Compliance with EMC Directives

In order to conform to the EMC Directives, the customer should evaluate the final system (overall system) and take necessary countermeasures. As examples of EMC countermeasures for single YAMAHA robot product are described in the user's manual, these descriptions should be referred to.

■ Cautions regarding official language of EU countries

Only English which is the official language of the EU is utilized in the manuals, warning labels, operating screens, and the Declaration of Incorporation for this product.

If warning text appears on the warning label, then Japanese may also sometimes be listed along with the English.

Cautions on KCs (Korean Certificate Safety) specifications

About KCs

KCs is a system that conforms to Korean Industrial Safety and Health Act and self-regulatory safety confirmation declaration of hazardous machines and devices. For machines specified in this system, the KCs mark needs to be indicated after conducting the forced certification or self-regulatory safety confirmation declaration. Industrial robots that have manipulators with 3 or more axes are specified as machines needing the self-regulatory safety confirmation declaration in South Korea's Ministry of Employment and Labor Notification No. 1201-46. Its safety standards are defined in separate table 2 of this notification.

About measures for KCs

For some YAMAHA robot models, this self-regulatory safety confirmation declaration is conducted to register these models. Additionally, the KCs mark is indicated on the robots that have been declared. When you investigate to purchase a robot to be used in South Korea, check whether or not this robot conforms to KCs and order it with the KCs specifications specified.

The YAMAHA robot is a unit that is incorporated into the customer's system. Therefore, when the customer incorporates the robot into the customer's system, additional safety measures need to be taken. For details, see "Safety standards application guide reference manual".

List of robots subject to KCs

Robot products may not be applicable to KCs depending on the customer's applications, operating conditions, or environments. Consult YAMAHA before purchasing a product.

Since a self-regulatory safety declaration has not been made for inapplicable models, these models cannot be used in Korea. Special-order robots are also unavailable. For details, please contact YAMAHA.

Cautions on Korean EMC specifications

About Korean KC

KC is a system based on the radio regulations of Korea. Devices specified by this system must certify compliance or register compliance, and indicate compliance. Applicable devices are defined by public announcement from the Korean National Radio Research Agency (NRRRA).

About Korean KC compliance

Some models of YAMAHA robot (robots and controllers) are registered with the Korean National Radio Research Agency (NRRRA) by self-test compliance registration. YAMAHA robots that have already been registered display the KC mark.

If you are considering the purchase of robots to be used in Korea, please check the table below for compliance before ordering the applicable product.

YAMAHA robots are devices for inclusion in a system; therefore, if you, the customer, build a complete system that includes robots, and ship that system as a final product to Korea or use it within Korea, you yourself must verify EMC compliance.

For TS series and TS-SD units, check "Examples of EMC countermeasures" within the user's manual; for other controllers, check this section within the "Safety standards application guide reference manual".

List of KC compliant robots

- * Please consult with YAMAHA before purchase, since compliance might not be possible depending on your application, conditions of use, and environment.
- * In the case of 3-axis or greater Cartesian robots and SCARA robots, the robot must be compliant with both KC and KCs. In conjunction with this table, refer also to the list of KCs compliant robots.

About non-compliant models

The following robots are subject to the KC system; however, since self-test compliance registration has not been done at the present time, they cannot be used in Korea. Additionally, special-order robots are also not compliant with the KC system.

Even for the various series listed in the table, some new models might not have been registered.

Repeatability positioning accuracy

The “repeatability positioning accuracy” cannot be guaranteed for the accuracy conditions listed below.

(1) Factors involving absolute accuracy

- Under conditions requiring accuracy between the robot controller internal coordinate position (command position) and real space position (movement position).

(2) Operating pattern factors

- Under conditions including a motion approaching close to a teaching point (position) from different directions during repeating operation.
- Under conditions where power was turned off or operation was stopped, even when approaching a teaching position from same direction.
- Under conditions where movement to a teaching position uses a hand system (left-handed or right-handed system) different from that during teaching. (SCARA robots)

(3) Temperature factors

- Under conditions subject to drastic changes in ambient temperature.
- Under conditions where temperature of robot unit fluctuates.

(4) Fluctuating load factors

- Under conditions where load conditions fluctuate during operation (load fluctuates due to workpiece or no workpiece).

Note 1. For the details of the semi-absolute model, please refer to P.39. RDV-P has an incremental model only.

Note 2. The robot cable is standard cable (3L/5L/10L), but can be changed to flexible cable. See P.614 for details on robot cable.

Note 3. If a flexible cable is needed for the SR1-P, TS-P, or RDV-P, then select 3K/5K/10K. On the RCX221, the standard cable is a flexible cable, so enter 3L/5L/10L when ordering.

Note 4. These controllers can be mounted on DIN rails. See P.522 for details.

Note 5. Select this selection when using the gateway function. For details, see P.66.

Note. It is possible to provide the model without a cable carrier. To find information on wiring (cable terminals) within the cable carrier see P.622.

Notes

- This table shows viewing angles when using the standard lens and close-up ring. (If no close-up ring this is closest approach.)
- If not using a close-up ring, then a WD smaller than the value in this table cannot be used.
- If using a close-up ring, then only a WD close to this value can be used.
- The values in this table are at most only a reference and do not signify an absolute index.
